

Shireesha Pulaganti

PROFESSIONAL SUMMARY

Results-driven **Full Stack Java Developer** with **3+ years of experience** delivering **scalable, high-performance enterprise applications**. Strong expertise in **Java and Spring Boot**, with hands-on experience building **microservices-based architectures** and well-designed **RESTful APIs**. Proficient in working with **relational databases** such as **Oracle and MySQL**, ensuring data integrity and optimized query performance.

Experienced in **containerization and deployment using Docker**, and in building **resilient, fault-tolerant systems** leveraging **Resilience4j**. Adept at maintaining high code quality through **unit and integration testing** using **JUnit and Mockito**. Well-versed in **API documentation, exception handling, and performance tuning**, contributing to robust and maintainable solutions.

A collaborative team player with solid exposure to **Agile/Scrum methodologies**, committed to continuous improvement and passionate about **solving complex technical challenges** in **product-driven engineering environments**.

TECHNICAL SKILLS

Programming Languages : Java (Java 8, Java 17), Java EE, Java 8 Features (Lambda Expressions, Streams API, Functional Interfaces, Optional)

Frameworks : Spring Framework, Spring MVC, Spring Boot, Hibernate/JPA, Log4j2, HikariCP, JUnit, Mockito

Web Technologies : JSP, Servlets, HTML, CSS, JavaScript, XML, RESTful Web Services

Cloud & DevOps : Microsoft Azure, Azure Blob Storage, Azure DevOps, Azure Pipelines (CI/CD), Variable Groups, Token Replacement

Authentication : Microsoft Entra ID (Azure AD SSO), Configuration Externalization, Environment-Based Configuration Management

Build Tool : Maven

Application Server : Apache Tomcat 9

Databases : SQL Server, Oracle Database

Version Control : Git, Azure Repos

Tools : Swagger (OpenAPI), Postman, Jira

Operating System : Windows

WORK EXPERIENCE

Project 1:

Title: Enterprise Java Application Cloud Migration & Modernization

Role: Java Developer

Environment: Java 17, Apache Tomcat 9, Maven, Azure Blob Storage, Azure DevOps, Azure Pipelines (CI/CD), HikariCP, Log4j2, Microsoft Entra ID (Azure AD SSO), Git, JSP, Servlets, Java EE, REST APIs, SQL Server.

Duration: February 2026 – Present

Client: Tata Technologies

Team Size: 1

Description:

The project involves modernizing and migrating multiple enterprise Java applications from an on-premises infrastructure to a cloud environment. As the sole developer, I was responsible for the complete migration lifecycle, including application analysis, modernization, implementation, testing, and deployment.

The migration included upgrading applications from Java 8 to Java 17 and deploying them on Apache Tomcat 9 while ensuring zero impact on existing business functionality. Legacy applications were modernized by replacing manual JAR dependency management with Maven to support automated builds and CI/CD.

To improve security and maintainability, all environment-specific configurations, URLs, database connections, and sensitive credentials were externalized and injected at deployment time using Azure DevOps Variable Groups and Token Replacement. Microsoft Single Sign-On (SSO) using Microsoft Entra ID (Azure AD) was implemented to provide centralized and secure user authentication.

Azure Blob Storage was integrated for cloud-based document storage, replacing on-premises file storage. Application performance was enhanced by implementing HikariCP connection pooling for efficient database connectivity, and a custom Log4j2 appender was developed for centralized logging and monitoring. Azure DevOps CI/CD pipelines were implemented to automate build and deployment processes across Development, QA, UAT, and Production environments, resulting in consistent and reliable releases.

Roles and Responsibilities:

- Independently managed the complete migration and modernization of multiple enterprise Java applications from on-premises infrastructure to the cloud.
- Upgraded applications from Java 8 to Java 17 and migrated deployments to Apache Tomcat 9 while maintaining complete business functionality.

- Converted legacy applications from manually managed JAR dependencies to Maven-based project structures to enable standardized builds and automated deployments.
- Designed and implemented Azure DevOps CI/CD pipelines for automated build, release, and deployment processes.
- Configured environment-specific deployments using Azure DevOps Variable Groups and Token Replacement to securely inject runtime configuration values.
- Externalized application properties, database configurations, service endpoints, and sensitive credentials to improve security and simplify environment management.
- Integrated Azure Blob Storage for scalable and secure document storage.
- Implemented Microsoft Single Sign-On (SSO) using Microsoft Entra ID (Azure AD) for centralized authentication and authorization.
- Improved application performance and optimized database connectivity by implementing HikariCP connection pooling.
- Developed and integrated a custom Log4j2 appender for centralized logging, monitoring, and troubleshooting.
- Performed functional, integration, and regression testing after migration to ensure seamless application behavior across environments.
- Resolved migration-related compatibility issues, optimized application performance, and provided production support during deployments.
- Maintained source code using Git and collaborated with stakeholders during requirement analysis, migration planning, and production releases.
- Participated in Agile development activities, including sprint planning, task estimation, code reviews, and release management.

Project 2:

Title : TransConnect – JioBP (Enterprise Digital Platform)

Role : Java Developer

Environment : Java 8, Spring Boot, Microservices, REST APIs, OracleDB, Kafka, Feign Clients, JPA, Resilience4j, JUnit, Mockito, Swagger, Docker, GIT.

Duration : Jan 2025 to November 2025

Client : Tata Elxsi

Description:

Trans-Connect is a digital enterprise platform developed for Jio-BP to modernize and streamline operations across multiple business domains. The legacy PL/SQL monolithic system was re-engineered into a microservices-based architecture to achieve higher scalability, maintainability, and integration efficiency.

The platform covers multiple functional modules including:

- Financial Management: Wallet creation, payment gateway integration (JioMoney, Razorpay, Amex), transaction processing, and reconciliation.
- Contract Management: Handling carrier agreements, payment terms, and lifecycle tracking.
- Onboarding Module: Carrier/customer onboarding with automated validation and KYC checks.

The system uses Kafka for asynchronous messaging, Resilience4j for circuit breaking, and Docker for containerized deployments. The platform delivers a modern, responsive user experience. The overall architecture ensures high availability, ACID-compliant transactions, and seamless integration across services.

Roles and Responsibilities:

- Designed and developed REST APIs using Spring Boot for financial transactions workflows.
- Migrated legacy PL/SQL monolithic processes into distributed microservices with OracleDB and MySQL.
- Integrated with external payment gateways (HDFC, JioMoney, Razorpay, Amex) and internal carrier systems.
- Implemented inter-service communication using Feign Clients and Kafka for asynchronous event-driven processing.
- Applied Resilience4j for fault tolerance and fallback mechanisms across critical services.
- Used JPA with @Transactional to ensure reliable financial and policy operations with ACID guarantees.
- Implemented logging (SLF4J), exception handling, and Swagger-based API documentation.
- Built unit and integration tests using JUnit and Mockito to maintain system reliability.
- Containerized and deployed microservices using Docker, ensuring portability across environments.
- Contributed to design reviews, UML diagrams, performance optimization, and Agile sprint planning.

Project 3:

Title : ReachMobile – Telecom Application
Role : Java Developer
Environment : Java 8, Spring Boot, Microservices, REST APIs, AWS S3, Maven, JIRA, Atlassian, HubSpot, JUnit, Mockito, Loggers, MySQL.

Duration : April 2024 to Dec 2024

Client : Reach Mobile

Description:

ReachMobile is a telecom domain application designed to manage end-to-end customer operations including **billing, payments, shipment, and invoicing**. The application was built using a **microservices architecture** and deployed on **AWS cloud infrastructure** for scalability and high availability.

Key features include:

Payment Service: Handling secure customer payments and integrations with external payment providers.

Billing Service: Generating, processing, and reconciling customer bills.

Shipment Service: Managing shipment tracking and logistics operations.

Invoice Management: Storing and retrieving invoices using AWS S3.

Data Storage: Persisting application data in AWS MySQL.

The application leveraged **AWS Lambda** and **Step Functions** for serverless orchestration, providing a cost-effective and resilient solution. **Jira and Atlassian tools** were used for sprint planning and issue tracking, while **production support** focused on resolving HubSpot-related issues.

Roles and Responsibilities:

- Developed and maintained microservices using Spring Boot for billing, payment, and shipment operations.
- Designed and implemented serverless workflows using AWS Lambda and Step Functions.
- Integrated MySQL for data storage and AWS S3 for invoice storage.

- Implemented REST APIs and ensured smooth communication between microservices.
- Configured and optimized Maven builds for microservice deployment.
- Worked on resolving production issues related to HubSpot integrations and customer management.
- Implemented logging and monitoring solutions for application debugging and performance tracking.
- Participated in Agile ceremonies, sprint planning, and backlog grooming using JIRA and Atlassian tools.
- Collaborated with cross-functional teams to ensure smooth deployments and production stability.

Project 4:

Title : Intermediate and Long-Term Care (iLTC)

Role : Software Developer

Environment : Java8, Spring Boot, Rest APIs, Microservices, MySQL, Tomcat, JUnit, Mockito, GIT.

Duration : April 2023 to September 2023

Client : Aja Consulting Services

Description:

iLTC enables care providers to interface with government referral systems efficiently for greater operational, financial, and clinical benefits. It offers nursing homes, home care, and retirement villages a comprehensive and integrated set of tools for operations, management, monitoring, and treatment of their residents.

Roles and Responsibilities:

- Used Core Java concepts such as Collections and Exception Handling.
- Involved in API gateway and Eureka server implementation for different microservices.
- Worked on circuit breaker design pattern for different microservices in the application.
- Implemented modules using Spring Boot.
- Developed REST APIs using microservices as per project requirements.
- Implemented SQL queries using MySQL.
- Used Maven for dependency management and build automation.
- Worked in Agile Scrum methodology, attending daily stand-up meetings.
- Used JIRA for issue/bug tracking and task monitoring.

- Collaborated with business team to gather and review system requirements.

EDUCATIONAL DETAILS

BSc Computer Science from Aditya Degree College, B Kotha Kota, Chittoor District.
